

Country Enforcement Index

The Country Enforcement Index (CEI) is a proportion of the number of trafficking instances seized in a country divided by the total number of trafficking instances that touched the jurisdiction, whether the instance was stopped there or simply transited through. A trafficking instance is defined as a singular incident of wildlife trafficking in or through a country, whether or not it was stopped there. The CEI contains an inherent bias based on a country's position in the supply chain (i.e. origin, transit, or destination). For example, because a shipment is either stopped at its destination or not stopped at all, destination countries have higher enforcement indices than origin or transit countries (which may miss shipments later seized in the destination country). For this reason, in the CEI above, China is compared with countries that are similar in location and/or trafficking profile. Trafficking profile is determined based on both the country's primary role in the supply chain and overall volume of trafficking instances. Additional information on the CEI is included on the back of this

Wildlife Transport Methods

Common Obfuscation Methods

Milk powder, chocolates, crab, fish, and wine have been used to obfuscate wildlife products in trafficking instances along Chinese air routes. Specifically, ivory, rhino horn, and pangolin shipments have been concealed in baked goods and confectionary products, including cookies, chocolates, and candy. In several instances, worked ivory wrapped in aluminum foil and hidden in milk powder have been seized on flights from Ethiopia.

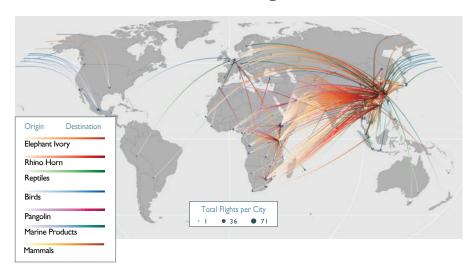

Aluminum foil appears as an obfuscation method almost exclusively for wildlife products transported in checked luggage or on the passenger's person. The majority of known Chinese air trafficking instances in which wildlife products were wrapped in aluminum foil originated in Africa. Wildlife products wrapped in foil are often further obfuscated with other materials, such as toiletries, electronics (e.g. speakers), and machinery.

China

Wildlife Trafficking Profile

2015-2019

Known Chinese Air Trafficking Routes

Country Trends: Marine Species and Smaller-Scale Ivory

China is the top destination country for known wildlife air trafficking routes and appeared in 42% of known Asian air trafficking instances. Approximately half of trafficking instances along Chinese air routes involved worked ivory product. While the number of known Chinese air trafficking instances involving ivory increased significantly over the five years of data (including quadrupling between 2018 and 2019), the average weight per seizure decreased from over 30 kg in 2015 to fewer than I kg in 2019. For known ivory air trafficking instances along Chinese air routes, Ethiopia was the most common origin country, followed by Japan and Laos. After ivory, marine products were the most prevalent species category for Chinese air trafficking instances (13%). These shipments most commonly originated from Mexico, followed by the Philippines and Hong Kong. Chinese customs authorities should be commended for releasing press statements on seizures—a valuable next step would be the inclusion of the mode of transportation of a seized shipment (not reported in over 30% of instances).

Recommendation: Share best practices on detection of worked ivory with the high-priority origin countries identified above and expand seizure reporting to include mode of transportation.

Case Study: Ivory and Pangolin in Foodstuffs

In September 2019, Chengdu customs officials seized ivory and pangolin products from Chinese nationals arriving at Chengdu Shaungliu Airport from Addis Ababa, Ethiopia.⁸ Alerted by suspicious imagery from the X-ray scan, officials discovered eight worked ivory products wrapped in aluminum foil and hidden in several different foodstuffs, including a can of milk powder, a package of gum, and a tin of cookies.⁹ In total, 0.861 kg of ivory and 1.1 kg of pangolin scales were confiscated.¹⁰

C4ADS Air Seizure Database

The C4ADS Air Seizure Database is compiled through extensive, multilingual open source research conducted by C4ADS analysts on a monthly basis, and supplemented wherever possible with additional information obtained through C4ADS' partner network. The publicly available resources C4ADS used for this assessment included, but were not limited to, customs press releases, local news reports, CITES annual reports, Robin des Bois's On the Trail Bulletins, TRAFFIC Bulletins, academic and statistical reports (e.g. CITES ETIS reports, etc.), and social media.

Data contained within the C4ADS Air Seizure Database is constantly being revised and updated to reflect the most current and accurate information available. As a result, changes are occasionally made to previous seizure data that may impact the analysis. The data used for this assessment was accessed in January 2020.

Data Gaps & Biases

The reliability of the data compiled within the C4ADS Air Seizure Database, and as a result C4ADS' associated analysis, is dependent on a variety of factors. Some airports and countries more proactively report on wildlife seizures, leading to an overrepresentation of those locations in the C4ADS Database. Further, some countries simply have better enforcement, while still others have effective customs and enforcement agencies but do not prioritize the identification of illegal wildlife. Data also varies due to differences in government seizure reporting protocols and to varying media and public interest. For instance, seizures of animals and animal products from charismatic species (like elephants) and species facing well-documented and intriguing challenges (like the totoaba) are more likely to receive media attention, and are therefore more likely to be captured in the C4ADS Air Seizure Database.

C4ADS analysts worked to minimize inconsistencies by researching every seizure to obtain as much information as possible, thereby filling in most gaps left by inadequate seizure reports published by a government agency or news outlet. Of course, some seizures still lack important information. In fact, some seizures lacked so much information that they could not be included in the C4ADS Air Seizure Database. At a minimum, C4ADS analysts needed the date of the seizure (at least the year), the location of the seizure (at least the country), and some indication as to the contents of the seizure to include it.

One of seizure data's biggest failings is inherent to its very nature—seizures can only capture trafficking strategies that have been ineffective. Along the same lines, seizures may reflect enforcement efforts operating as they should, and so high seizure numbers can be indicative of particularly effective enforcement activity rather than an indication of a problem, as they are often interpreted. To that point, another significant downside to seizure data is its frequent inability to determine the cause of trafficking patterns. For instance, high seizure numbers in an airport can be due either to effective enforcement or high volumes of trafficking activity—sometimes both. Without being able to count the true number of trafficking instances that move through that airport undetected, it is impossible to know which factor plays the greater role, and therefore how to respond—should enforcement strategies be revised and improved, or can the country's anti-wildlife trafficking strategy shift to begin to address wildlife trafficking before it reaches the airport, since enforcement within the airport is already functioning as needed?

Although there are no perfect solutions to these problems, comprehensive data collection can serve to alleviate a few. Detailed route information, for example, can help to reveal whether illegal wildlife shipments are successfully moving through an airport to be seized elsewhere (suggesting poor enforcement or limiting legal frameworks), or if they are primarily seized prior to arrival at an airport (no implication for enforcement effectiveness), or within an airport (suggesting good enforcement). As a result, C4ADS strove to base the analysis on detailed seizure data, supplemented with additional information wherever possible. In this assessment, C4ADS provides seizure analysis with the acknowledgement that seizure data are an imperfect measure of an immeasurable crime, but with the understanding that even with its shortcomings, seizure data provide a rare window into otherwise clandestine trafficking operations.

The mention of any individual, company, organization, or other entity in this assessment does not imply the violation of any law or international agreement, and should not be construed as

Country Enforcement Index

The Country Enforcement Index is intended as a comparison of enforcement effectiveness for countries with similar supply chain roles (e.g. origin, transit, and destination countries). A high enforcement index suggests effective screening and interdiction operations. However, the metric contains an inherent bias regarding a country's role in the supply chain. For example, destination countries are the last stop for a wildlife shipment--if the shipment is not seized here, then it is not known to have successfully entered the country. Due to this bias, the CEI is not intended for comparisons of countries that primarily serve different functions in the illicit wildlife trafficking supply chain (e.g. an origin country to a destination country).
